# Design

## Some normalisation challenges were...

Including US states in the normal locations, this required the location name to be used as an ISO\_CODE.

Another challenge when it came to normalisation, was that the vaccine type in the files of the individual countries (Australia, Canada etc.) were all included in one field, what had to be done was if there was for example, Australia, Pfizer and Moderna Vaccine, and 1000 vaccinations. There were two rows created with Australia, Pfizer Vaccine, and 1000 vaccinations, and then Australia, Moderna Vaccine, and 1000 vaccinations. And the column IS\_SHARED had to be created to ensure that there is not a confusion when it comes to the duplicated individual rows. As IS\_SHARED represents if this number of total vaccines are shared with others.

Another challenge was row duplication, as there were the same named rows in different tables that had to be excluded. The only problem was that in some cases, even though the rows seemed auto-generated, they were either inconsistent, or not auto-generated.

Another issue, as said, was relying on the fact that the data was consistent between tables, this was more of an assumption, and an assumption that was relied on heavily throughout this process.

Furthermore, another challenge was that there were fields that are already in multiple tables but had inconsistent data.

Field names were consistently ambiguous, and hard to decipher their meanings. GitHub README was referred to in order to assist in this challenge

## Assumptions

1. In general data was integral
2. Removed Vaccine from the Master table assuming there is data integrity
3. people\_with\_booster\_per\_hundred = total\_boosters\_per\_hundred
4. source\_url = source\_website

Database Schema

**Location\_info**(iso\_code, Location, source\_url, Location\_Type, last\_observation\_date, source\_name)

**Vaccination\_By\_Location**(iso\_code\*, Date, people\_vaccinated, people\_fully\_vaccinated, total\_boosters, total\_vaccinations\_per\_hundred, daily\_vaccinations\_raw, daily\_vaccinations, daily\_vaccinations\_per\_million, daily\_people\_vaccinated, daily\_people\_vaccinated\_per\_hundred, total\_distributed, distributed\_per\_hundred, share\_doses\_used)

**vaccinations-by-manufacturer**(iso\_code\*, date, vaccine\*, total\_vaccinations)

**vaccinations\_by\_age\_group**(iso\_code\*, date, age\_group\*, people\_vaccinated\_per\_hundred, people\_fully\_vaccinated\_per\_hundred, people\_with\_booster\_per\_hundred)

**Vaccine**(vaccine)

**age\_group**(age\_group)
